

Passwords

Strong - Secure - Safe

Why do we need passwords?

Passwords are designed to keep your personal and professional files, information and services confidential and secure!

Who should know my password?

Only you should know your own passwords
Never tell anyone else your password,
it should be kept private and secure!

What is a STRONG password?

Passwords should always be as strong as possible to stop other people guessing them and preventing hackers brute forcing their way in!

A strong password should always include numbers and symbols. Passwords should be at least eight characters in length to make them as secure as possible. Try thinking of a word that is personal to you and then switching some of the letters for symbols or try using a passphrase!
